

NFT to make decentralized governance fair

Alfazero

Governance Democratization

Why is governance unfair?

Governance in a **decentralized world** plays a big role in defining the roadmaps as well as the direction of the protocol.

Big whales with **big voting power** can influence the future of the protocol which might not be favorable for small token holder.

Why is governance unfair?

We combine the power of **NFT** to **voting** by giving small stakeholder voters weighted advantage.

Small token holders who vote consistently in the winning proposal will be able to unlock new categories of **NFTs** giving them more voting power.

This will give small token holders a chance to **compete** with big whales in the **governance** process.

Roadmap

Governance tokens come with certain rights regarding the project they are attached to, which often include the ability to **vote** on the project's developments & directions.

As a **DAO** we are going use these **governance tokens** to gather interested **stakeholders** around innovative projects, enabling them to take a direct part in the future of the organization itself.

Business Model

Tokenomics:

Tokens will be **equally shared** between holders of governance token and founders.

In addition to minting NFT, Alfazero(zero) **tokens** will be **airdropped** to the wallets who performed voting.
